Recruitment Team
Research Assistant (Remote)

October 9, 2026

Dear Hiring Team,

I am applying for the Research Assistant (Remote) position in AI facial data collection. I am an R&D engineer and PhD candidate with more than five years of applied research at CNR-STIIMA, the Italian National Research Council, where collecting reliable data from people is a central part of my work.

For my PhD project, OmniTrack, I collected and validated position (x, y, z) and IMU data from 16 blind participants under experimental protocols. I was responsible for the whole chain: setting up the sensors, running the sessions, checking the quality of each recording, keeping the logs and analysing the data in Python. I have not collected facial images before, but the discipline is the same: a clear protocol, consistent capture conditions, accurate metadata and a record of every session that can be audited later.

I also understand what the data is for. I have built embedded machine-learning classifiers with TensorFlow Lite, so I know how the quality, variety and labelling of a dataset decide how well a model performs, and why a diverse sample matters.

My studies involve human participants, including blind adults and children in clinical settings, so I am used to working with informed consent and personal data under GDPR.

I work well on my own. I have carried out research stays at Utrecht University and Toyo University in Tokyo, and I am used to organising my work and reporting to teams in other countries with little supervision.

I would be glad to discuss the role further.

Yours faithfully,

Giovanni Tauro
