Dear Ethos Team,

I am applying for the Design Researcher opportunity to help train a language model on professional research documents. I am Head of Product and co-founder of Rehabilia Technologies, and for more than five years I have run user research at CNR-STIIMA, the Italian National Research Council. Judging whether a findings deck or an interview synthesis is actually useful is part of my daily work, so I would enjoy doing it for AI-generated ones.

I own studies from start to finish. I write the study protocol, run interviews and usability tests, collect questionnaire data, analyse it and turn it into findings that a team can act on. I have run studies with 16 blind participants for an indoor navigation system and with children with cerebral palsy for a rehabilitation game, which we published as a usability and acceptability pilot study in the *Italian Journal of Pediatrics*. At Rehabilia, our device PhiCube reached a usability score of 85.8/100 (SUS) with 19 children, and I translate interview findings into journey maps, product recommendations and priorities for clinicians, partners and funders.

Most of my output is written: study protocols, reports, papers, technical documentation and presentations, so I care about clear structure and precise wording. I also use Claude and Claude Code every day to draft, analyse and structure documents, and I hold Anthropic's certifications for both, so I know where model output tends to look polished but miss the point.

My research has been in healthcare and assistive technology rather than commercial software, and I have used standardised questionnaires more than custom survey instruments. The core skills are the same: planning a study, listening carefully and turning raw data into conclusions people can trust.

I can work flexibly, and I would welcome the chance to contribute.

Sincerely,

Giovanni Tauro
