Dear SUPACAZ Team,

I am applying for the 3D Industrial Designer & CAD Specialist role. I trained as an industrial designer (BSc, University of Florence; MSc in Design & Engineering, Politecnico di Milano), and for more than five years I have taken physical products from sketch to tested prototype at CNR-STIIMA, the Italian National Research Council, and as Head of Product and co-founder of Rehabilia Technologies.

My main project is PhiCube, a modular device for neurorehabilitation. I worked on it from user research and concept sketches to mechanical design, assembly and deployment in Italian clinics, and I am a co-inventor on its patent (WO2023214349A1). It reached a usability score of 85.8/100 (SUS) with 19 children and is now in two ongoing multicentre studies with 134 patients. A product that people use with their own bodies, session after session, has to be robust, adjustable and pleasant to use, which is not far from what a rider expects from their gear.

Day to day I model parts, assemblies and technical drawings in SolidWorks and Fusion 360, build prototypes with 3D printing, choose materials and manufacturing methods by batch size, cost and technical constraints, then test and iterate on user feedback and performance data. I document design intent in technical files and manuals, and as Head of Product I coordinate external suppliers and keep engineering, design and clinical partners aligned.

Sport has been part of my design work from the start. As a freelancer with DIMA3D I reverse-engineered parts for extreme-sports, automotive and medtech clients, turning 3D scans into parametric CAD models ready for production. At Adidas, working remotely, I developed sportswear concepts from trend and competitor research, defined materials and colours within the brand's language, and produced Blender renders and an AR experience. Outside work I ride a longboard and hike in the mountains. My research has also taken me to Utrecht and twice to Japan, so working across countries and time zones with California, Taipei and Tokyo would feel familiar.

My products so far have been rehabilitation devices rather than cycling components, and my production experience is mostly 3D printing and small batches: I have not yet taken a carbon-fibre or injection-moulded part to production, and I model in SolidWorks and Fusion 360 rather than Rhino. These are the areas where I would expect to learn the most, working with your engineers and suppliers. My portfolio and GrabCAD models are linked above.

I would welcome the chance to discuss the role further.

Sincerely,

Giovanni Tauro
